Kibblewise

A 24/7 AI assistant for pet owners

Pre-seed · October 2026

Maya Okafor, Founder and CEO

https://kibblewise.github.io

The problem

- Pet owners have hundreds of small health and food questions every year.
- At night, clinics are closed and the web gives ten different answers.
- Owners either panic and pay for an emergency visit, or wait too long.
- Clinics lose hours a day to phone questions that need no appointment.

Our solution

A chat assistant that knows your pet and answers in plain words, at any hour.

Pet profile

Breed, age, weight and allergies, entered once.

Three signs

Fine at home, call your vet today, or go now.

Vet-checked

Answers come only from a library our advising vet has reviewed.

Product today

A working prototype on iPhone and Android.

- Used only by a small test group of friends and family.
- No public launch yet, and no active users outside the test group.
- Public release planned after the pre-seed round.

Market

70 million

dog and cat households in the US and Canada (our estimate)

$1.2B

yearly market for pet-owner advice subscriptions (our estimate)

First target: dog and cat owners in Canada, then the United States.

Business model

Consumer subscription, sold directly to pet owners (B2C).

Free

Five questions a day, emergency guidance always free.

Plus, CA$7.99 a month

Unlimited questions, up to four pets, health diary, reminders.

Early signs

2,300+

pet owners on the waitlist

2 clinics

signed letters of intent to recommend us at launch

No revenue yet. Waitlist sign-ups are not users.

Competition

- Web search and pet forums: free, but slow and often wrong.
- Vet video-call apps: helpful, but they cost money per call and need a booking.
- General AI chatbots: fast, but they do not know your pet or when to stop.

Kibblewise is the only one built around one pet's history and a vet-checked library.

Team

Maya Okafor, Founder and CEO

Six years as a veterinary technician at a Toronto clinic. Writes most of the code. Solo founder.

Help

Jonah Lee, freelance product designer, two days a week.
Dr. Anika Shah, advising veterinarian.

The round

Funding so far: none. Kibblewise is self-funded from Maya's savings.

Next round: we plan to open a US$500,000 pre-seed round in about four months, in late February 2027.

Instrument: not decided yet, SAFE or priced.

Use of funds: first engineer 50%, vet review of the answer library 20%, launch marketing 30%.

Burn today: about CA$1,800 a month, mostly cloud and design.

Company: not incorporated yet. We will incorporate as a Canadian federal corporation before the round. We have not used any startup credit programs.
